Summary

- Hands-on backend lead, 5+ years in crypto trading and analytics. Led the backend of DexCheck, a DEX analytics platform, for 3.5 years and managed a team of 4–5 (backend + DevOps) from 2024 to 2026. Made the PostgreSQL to ClickHouse call that cut P&L queries from **15+ minutes to under a minute**, and led incident response on a 3B+ row Solana pipeline. Now own the backend and on-chain work for a zk-rollup DEX (Rust, SP1, Solidity), after a Go exchange prototype.

Technical Skills

Languages: Python, Go, Rust, Solidity, SQL, JavaScript
Backend: FastAPI, Flask, REST APIs, WebSockets, Celery, OAuth 2.0, JWT, RBAC, API keys, token-bucket rate limiting
Data & Messaging: PostgreSQL, ClickHouse, Redis, Elasticsearch, Kafka, RabbitMQ, schema design, Alembic migrations, vector/hybrid search
Infrastructure: Linux, Docker, bare-metal servers, AWS EC2, GitHub Actions CI/CD, Prometheus, Grafana; unit, integration and load testing

Experience

Stackera **Feb 2026 – Present**
Backend Lead (Full-time) *Remote (Pune, India)*
Exchange client projects; some ran in parallel.

- **Zk-rollup DEX** (Jul 2026 – present, in development): own the backend and on-chain work. Rust for the canonical state logic, SP1 (zkVM) for proving, and Solidity contracts on Ethereum.
- **Centralized exchange prototype** (Jan – Jul 2026, not launched): built the Go backend, including the order matching engine, risk management (RMS), a durable balance ledger, a price oracle built from major exchange prices, and an in-house market maker.
- **AI assistant** (Dec 2025 – Aug 2026): built the Python retrieval and orchestration layer (RAG, hybrid search, ClickHouse) for an exchange's support and marketing assistant.

Stackera **Apr 2022 – Feb 2026**
Software Engineer III (Full-time) *Remote (Pune, India)*

Client project: DexCheck (DEX analytics platform) | Role: Backend lead *Jun 2022 – Jan 2026*

- After heavy P&L reads caused a production outage, moved wallet P&L analytics from PostgreSQL to ClickHouse. On a 2B+ row Solana trades table, rolling P&L for wallets with millions of trades stayed slow even with indexes and per-token batching. P&L queries went from **15+ minutes to under a minute** for 99% of wallets.
- Led the response when repeated P&L requests for one high-volume wallet overloaded the Solana database and stopped indexing: killed the running queries, disabled those reads, and limited P&L to wallets under a trade-count threshold using a precomputed trade-count table, then handed follow-up fixes to the team.
- Managed 4–5 engineers (backend + DevOps), Jun 2024 – Jan 2026: planned and assigned work, ran design and code reviews, and was the technical contact for product and the client.
- Designed the ingestion pipeline: chain data streamed over WebSockets into Kafka, then PostgreSQL as source of truth, ClickHouse for analytics, Elasticsearch for search. Solana data reached **3B+ transactions**, growing 25M+ rows/day; at peak, read up to 4k transactions/sec from the chain and decoded and stored 1k+/sec.
- Owned the Python REST API, WebSocket feeds and real-time alerting: **10,000+ API users**, 100,000+ monthly active users at peak, 500,000+ requests/day, with p95 under 100ms and p99 under 500ms on key endpoints.
- Built ingestion for 20+ chains and 40+ DEXs, with idempotent writes, retries, backfills and reconciliation so missed data could be replayed without duplicates; ran background jobs on Celery/RabbitMQ.
- Built the paid-API layer: Google OAuth sign-in, JWT sessions, hashed API keys, RBAC for subscription tiers, and Redis token-bucket rate limiting per user and IP.

Stackera **Jul 2021 – Apr 2022**
Associate Backend Developer *Remote (Pune, India)*

- Built algorithmic-trading and analytics services on exchange APIs; ran blockchain and graph nodes on Linux servers.

Earlier Experience

- Software Engineer, C Simplify IT; Freelance Python Developer; Full Stack Developer Intern, Edugorilla Nov 2020 – Jul 2021

Education

Pusa Institute of Technology **2012 – 2015**
Diploma in Electrical Engineering *New Delhi, India*
